

Project Name:

LaunchPad AI

Team Members:

Chanchal Patni, Shilpa Kumari

Max Marks:

2 Marks

Define Your Technology Stack

Identify the programming languages, frameworks, databases, front-end tools, back-end tools, and APIs that you will use to build your solution. A well-chosen technology stack ensures that your application is scalable, maintainable, and aligned with your project requirements.

S.No	Architecture Component/Layer	Technology Chosen	Justification / Purpose
1	Frontend / Client-Side	HTML5, CSS3 (Tailwind CSS), JavaScript	Enables a fully responsive design interface. Tailwind CSS accelerates layout development while maintaining clean component scannability for dynamic startup metric cards and analytical dashboard grids.
2	Backend / Server-Side	Python / Flask	Chosen for its lightweight footprint and rapid route prototype processing capabilities. Provides excellent out-of-the-box support for API call multi-threading and integrates natively with modern AI SDK libraries.
3	Database / Data Storage	SQLite	A zero-configuration, relational mapping tool. Perfect for handling lightweight session logging, system setup attributes, and dependency indicators locally without adding database infrastructure overhead.
4	Cloud / Hosting / Deployment	Ngrok Tunneling Engine	Provides immediate, cost-effective, and secure public-facing HTTPS application mapping from our local testing runtime directly to external evaluators without complex cloud cluster provisions.
5	Version Control & CI/CD	GitHub	Ensures seamless version control management and asynchronous code branch collaboration. Tracks active updates to prompting components and template workflows reliably.

S.No	Architecture Component/Layer	Technology Chosen	Justification / Purpose
6	Third-Party APIs / Other Tools	Google Gemini 1.5 Flash API	Acts as the core business intelligence evaluation engine. Enables fast processing of advanced startup concept text analysis, multi-criteria validation calculations, and automated SWOT matrices.
