

Project Name: LaunchPad AI

Team Members: Chanchal Patni, Shilpa Kumari

Maximum Marks: 5 Marks

Project Proposal Template

Smart Ledger (Problem Statement, Novelty, Feasibility & Tools)

1. Problem Statement

Early-stage startup entrepreneurs and startup evaluators frequently struggle with initial assessment pipelines. Founders lack a centralized framework to refine raw, unstructured business concept drafts or systematically evaluate their commercial market potential. Concurrently, technical program judges and evaluators encounter massive inefficiencies when vetting submissions manually due to inconsistent criteria formats, opaque feature metrics, and a total absence of automated baseline viability checking.

2. Novelty / Proposed Solution

LaunchPad AI serves as an intelligent, unified architectural launchpad engineered to securely log, validate, and analyze early-stage technical concept parameters. By combining structured prompt pipelines via the Google Gemini 1.5 Flash inference engine with a responsive analytical dashboard layer, the system generates instantaneous, multi-layered viability data models and visual SWOT matrices. This provides founders with automated, actionable refinement feedback while giving evaluators a standardized ledger of analytical scores.

3. Feasibility / Impact

The architectural design is highly executable, cost-effective, and optimized for rapid integration. It utilizes a lightweight, local SQLite database management configuration, modular python microservices managed via Flask, and secure port-forwarding mechanisms using Ngrok to expose the core application externally without expensive hosting dependencies. The operational impact is significant, reducing initial baseline concept vetting cycles from days to minutes while increasing structured grading accuracy for early-stage enterprise incubators.

4. Technology Stack & Tools Used

- **Frontend Client Layer:** HTML5, CSS3, Tailwind CSS, JavaScript for responsive visual layouts and data dashboards.
- **Backend Application Gateway:** Python utilizing the Flask core web engine for endpoint configuration and routing modules.
- **AI Core Inference Pipeline:** Google Gemini 1.5 Flash API for advanced textual structural evaluation and deep SWOT assessments.
- **Local Cache Storage Tier:** SQLite Relational Store to map session configurations, metrics, and user validations.
- **Deployment Tunnels:** Ngrok Reverse Tunneling Engine to bridge local hosting infrastructure with live web endpoints.
